No. 65 Compact Type Telephone

This is the Standard Type of Wall Telephone used for Rural and Village Party Line Magneto Service

EVERY detail in its construction and circuits is the result of a careful study of **actual operating requirements** and is particularly designed and built for **efficiency of service** and **economy of operation**.

Features of the No. 65 Telephone

Cabinet The cabinet is made of well seasoned quarter-sawed golden oak, finished in golden oak shade with the best grade of filler and varnish. "Hand Rubbed" so as to insure a finish that is durable and not easily marred.

Transmitter The transmitter, which is mounted on a neat pressed steel arm, is the popular **No. 10 Platinum Electrode Long Distance Transmitter**, with metal mouthpiece. Strong, rigid and a "splendid talker," clear and distinct for both local and long distance conversation.

Receiver The receiver is the permanently adjusted standard type furnished with 36 inch cord provided with hooks at each end fastened into the outer braid to take the strain off the conductors. The shell is of high grade composition sufficiently heavy to guard against breakage. An exceptionally efficient and well made article.

Generator The generator is heavy, compact and well built. Nothing but the best magnet steel, wire and material used in it. It is made to easily ring through on long heavily loaded party lines.

Ringer The ringer is self-contained, i. e., all assembled in a unit in the frame. The gongs, mounted on adjustable posts attached directly to the frame, give a clear distinct ring.

More Details of the No. 65 Telephone

Induction Coil The induction coil core is wound with the best grade insulated *No. 306, L. B.* wire. The coil core is special annealed iron wire. The spool best quality fibre. Connections are made by the use of open end solder clips so you can remove the coil without breaking any soldered connections.

Hookswitch The hookswitch is constructed on simple lines. The *No. 30* special design of the long actuating spring insures positive contacts, making the operation most reliable. The springs are made of special spring alloy.

Arrangement All parts of this instrument are conveniently located so that you can see all the construction easily and make an inspection quickly.

Wiring The wiring is made up in cable form and run inside the cabinet and perfectly protected. The door hinges do not form any part of the circuit.

Extra Equipment The instrument is so wired that you can put in the sure *Condenser No. 83* ring through condenser in the *Push Button No. 74* receiver circuit and the push button key for calling Central secretly without disturbing the wiring, thus doing away with the usual cost of rewiring. An excellent feature.

Completeness The instrument is furnished complete ready for service and includes two cells of dry battery.

No. 90. Desk Type Telephone

YOUR attention is called particularly to the numerous points of excellence in this Standard Desk Instrument. It is **all metal** with a Gun Metal Finish that will not wear or scuff off or change color. It is very artistic in design, light in weight and has a metal mouth-piece.

We have made the **transmitter rigid**. It is placed at just the right angle for producing the best talking results, and does away with the knuckle joint which so often gets out of order. Another thing is that every part is easily accessible, and much time is saved in inspection because the screws cannot be lost or misplaced.

The leather cushion ring on base does not scratch the desk and is practically indestructible—is far better than felt. The **No. 90** instrument is wired for use on any system—**either common or local battery**. We recommend it as being thoroughly and fully reliable in all respects.
